ROM 1.0 Release Note

One of the features of ROM 1.0 (as well as Beta 3.xx and all Gamma) firmware is that it implements the Trademark (or TM) feature. This is a small piece of code containing the CDTV trademark logo. If this code does not appear on the CD, the CDTV player will not recognize it as a legitimate disc and indicate this by changing the boot screen to orange. This is a new feature so that most existing discs would not have this TM on it. There is a way to play non-TM discs with the new Gamma firmware.

Connect an external floppy drive to the CDTV unit. Insert a blank, formatted, non-installed floppy disk in the drive and the non-TM application disc in the CDTV unit. Turn on the power or press the RESET button and the application should run normally.

The external floppy drive is not needed when playing a current disc containing the TM code.
